Title : Experimental Treatment of Gastrointestinal Catarrh in Swine with Terramycin and Aureomycin.

Orig Pub : Magyar allatorv. lapja, 1957, 12, No 1-2, 15-17

Abstract : Experiments in the use of antibiotics for the prophylaxis and treatment of swine in the course of fattening are described. The effectiveness of both antibiotics, especially that of terramycin, was established. Young pigs over 30 kg. should daily receive 330 mg. of terramycin and 660 mg. of aureomycin each for 3 days. Treatment with antibiotics reduces the time of fattening by 2 weeks and improves the gain of animals. -- V. A. Kanzyuba.

Title : Test of Treatment of Chicks with "Neftin" During
Infection with Typhoid and Paratyphoid

Orig Pub: Magyar allatorv. lapja, 1957, 12, NO 6, 174-176

Abstract: In two tests, chicks (six-day-old and one-day-old) were infected with cultures of *Salmonella gallinarum* and *S. typhimurium*, and in a third test (one-day-old chicks) only with *S. gallinarum*. In each test, 50 percent of the birds received "neftin" with their feed (preparation of furazolidone)

Card 1/2

in concentrations: in the first two tests, 0.005 percent; in the third, 0.04 percent. It is shown that feeding of I in a concentration of 0.04 percent for 12 days prevented murrain in chicks infected with *S. gallinarum*. However, sterilization of the organism is not achieved, and 5.3 to 38.2 percent remained with bacilli vectors. With respect to data in the literature, I proved to be ineffective against *S. typhimurium* and *S. thompson* (*S. thompson* was not administered for infection, but it was found in the feces of dead chicks). Feeding of I in a concentration of 0.005 percent had no therapeutic effect and seemingly contributed to the increase of bacilli vectors.

"Etiological Studies Involving Influenza of Geese I. Virus Isolation."

Budapest, Magyar Allatorvosok Lapja, Vol 22, No 1, Jan 67, pages 9-11.

Abstract: [Authors' English summary modified] In an influenza epidemic involving 2-4 week old goslings, the virus was successfully isolated from the cadavers, especially the bowel content, of animals which succumbed to the disease. Syncytia and cytoplasmic inclusions were produced by the virus in monolayer cultures of goose kidney tissue. The infectivity of the virus remained unchanged after treatment with 20 % ether or chloroform, 0.1 % Na desoxycholate or Na dodecylsulfate, 0.25 % trypsin and also by a low (3.0) pH of the medium. The virus was not stabilized by a molar solution of MgCl₂ at 50° C. Studies with IDUR indicated that the virus contains RNA. The virus was successfully propagated in embryonated hen and goose eggs; it killed the embryos and produced characteristic lesions both in the embryos and in the chorion allantoic membrane as well. The virus could also be propagated in monolayer cultures of chicken kidney tissue. Cultures infected with the virus failed to adsorb erythrocytes of the chicken, goose, mouse, guinea pig and rabbit and the virus did not agglutinate cattle erythrocytes. On the basis of these properties, the virus is thought to belong to the REO-group of viruses. 1 Hungarian, 5 Western references.

"Etiological Studies Involving Influenza of Geese II. Infection Studies Using the Isolated Virus."

Budapest, Magyar Allatorvosok Lapja, Vol 22, No 1, Jan 67, pages 11-14.

Abstract: [Authors' English summary modified] Infection tests were carried out on 5 groups of goslings from different breeding stations, using one of the isolated virus strains. Enteritis and anorexia developed in some of the goslings together with retarded development. The losses were comparable to those incurred in natural outbreaks of the disease. Clinical symptoms and pathological lesions characteristic of goose influenza occurred in 2 cases only, however; in these, Haemophilus anserisepticus was also isolated from the organs of the cadavers. The virus used for infection could be re-isolated from half of the cadavers only and almost exclusively from the bowel content. The virus was excreted with the feces for about 3 weeks. Virus neutralization tests using pre-infection serum samples of one of the groups proved that considerable quantities of specific antibodies were absorbed by the goslings from the yolk. The role of caretakers, fodder and tools in spreading the virus is stressed. Apparently healthy newly-hatched goslings can be infected with the

"Gross and Microscopic Lesions in the Nasopharynx of Pigs with Aujeszky's Disease"

Budapest, Acta Veterinaria Academiae Scientiarum Hungaricae, Vol 16, No 2, 27 Jun 1966, pp 175-185.

Abstract: [English article] The authors attempted to clarify whether the frequent pharyngeal lesions (necrosis of the palatine tonsils and pharyngeal mucous membrane) are associated with the multiplication of the virus of Aujeszky's disease or are secondary in nature. The main approach was the pathological and histological examination of organs from naturally infected, emergency-slaughtered pigs and the determination of the virus content in them. The findings, presented and discussed in some detail, indicated that the lesions were primary in nature, attributable to the action of the virus. The gross lesions were not specific; however, it appeared that the microscopic lesions are specific. 11 references, including 4 Hungarian and 7 Western. (Manuscript received 10 Sep 1965).

"Macroscopic and Microscopic Lesions in the Nasopharyngeal Cavity of Pigs
Affected with Aujeszky's Disease."

Budapest, Magyar Allatorvosok Lapja, Vol. 21, No 2, Feb 66, pages 53-56.

Abstract: [Authors' English summary modified] The lesions described were found in pigs of all ages infected either naturally or artificially with the virus of Aujeszky's disease. Pathologic lesions in the mucosa of the nasal and pharyngeal cavity were found in 15-20 per cent of the infected cases. Macroscopic lesions were found in the tonsils of 60 per cent of the animals. These consisted of superficial and deeper necrosis of the mucosa and necrotic foci in the tissues of Waldemeyer's lymphatic ring. Histological study of the lesions revealed damage to the epithelial layer, the formation of syncytia, activation of the lymphoid elements of the connective tissue and the formation of inflammatory and necrotic foci. The network of lattice fibers was also increased, followed by disintegration. Primary cause of the lesions was the growth of the virus in these tissues. Although not specific in the classical sense, the lesions are regarded as characteristic of the disease. The histological picture, especially the syncytium formation and the presence of intranuclear inclusion bodies, are specific for the disease. 5 Hungarian, 4 Western references.

"Mass Affliction of Pigs with Swine Erysipelas after Feeding of Raw Fish Cadavers."

Budapest, Magyar Allatorvosok Lapja, Vol 17, No 11, Nov 62, pp 429-430.

Abstract: [Author's English summary] A severe swine erysipelas epizooty was observed at a large fattening station as a consequence of feeding raw fish cadavers. *Erysipelothrix rhusiopathiae* could be isolated from the gills and from the muscles of the fish. The antigenic properties of this strain differed, however, from those of the strains isolated from the swine cadavers. [One Hungarian, 2 German references.]

Title : Investigations of EEG in Narcolepsy

Orig Pub : Ideggyogy. szemle, 1957, 10, No 1, 9-15

Abstract : In 14 cases of narcolepsy (7 with cataplexia and 7 without it), no abnormal oscillations were discovered on the EEG during the periods between seizures and in experiments with tetracore and evipan. The basal lead of EEG did not differ from recordings on the surface of the head. In seizures of narcolepsy, the B₁ - B₂ stages according to Davis were manifested on the EEG earlier than under normal conditions. This data of the picture of the disease does not indicate that it belongs to epilepsy.

"Thoracic Surgical Interventions Performed Through Axillary Penetration"

Budapest, Magyar Sebeszet, Vol 19, No 5, Oct 66; pp 279-281.

Abstract: To evaluate the advantages of "axillary section," authors have extended the functional indications of penetration to the broad area of thoracic surgery. On the basis of experience acquired with 114, predominantly elderly patients on whom such operations were performed, the authors believe that this kind of penetration offers the same surgical conditions as those obtained by other kinds of penetration. For this reason this procedure is preferable in the case of patients with low resistance. 12 References, predominantly Hungarian.

TITLE: Space group and lattice parameters of some phenylhydrazone¹ derivatives of monosaccharides

SOURCE: Academia scientiarum hungaricae. Acta chemica, v. 46, no. 3, 1965, 191-193

TOPIC TAGS: hydrazine derivative, carbohydrate, crystal lattice parameter, x ray study

ABSTRACT: X-ray studies were conducted to establish the space group and lattice parameters of O-tetraacetyl-D-glucose-2,4-phenylhydrazone, O-triacetyl-D-xylose-2,4-phenylhydrazone, and O-triacetyl-D-xylose-2,4-phenylhydrazone. Laue groups of mmm, 2/m, and P2₁, respectively, were assigned to these compounds. The crystals are orthorhombic, monoclinic, and monoclinic, respectively. The authors thank Doctor A. Foti, Scientific Assistant, Department of Chemical Technology, who made the substances available. Orig. art. has: 1 figure. [Orig. art. in German.] [JPRS: 34,165]

AUTHOR: Csordás, Zoltán

TITLE: The properties of flexible diaphragms and their design. I

PERIODICAL: Mérés és Automatika, no. 1, 1963, 29-31

TEXT: The technical and economical advantages of flexible diaphragm mechanisms are discussed. A simple instrument is described, for determining the effective diameter and surface of an ideal frictionless piston, which will have power characteristics comparable to those of a diaphragm, under identical conditions of pressure. A theoretical calculation of these static characteristics was first published by I. Lichtens (Compt. Rend. Seanc. Acad. Sci., 209, 1939, 4), and a geometrical method by V.V. Afanasyev (Ob izmenenii effektivnykh ploschadey membran; sistemy, ustroistva i elementy pnevno i gidroavtomatiki, 1959). All these methods serve only as a guide, since the properties of diaphragm materials cannot be fully taken into account. The hysteresis and ageing factors are also mentioned.
